

# MATHEMATICS

# Relations and Functions

## Top Concepts in Relations

### 1. Introduction to Relation and no. of relations

- A relation  $R$  between two non-empty sets  $A$  and  $B$  is a subset of their Cartesian product  $A \times B$ .
- If  $A = B$ , then the relation  $R$  on  $A$  is a subset of  $A \times A$ .
- The total number of relations from a set consisting of  $m$  elements to a set consisting of  $n$  elements is  $2^{mn}$ .
- If  $(a, b)$  belongs to  $R$ , then  $a$  is related to  $b$  and is written as ' $a R b$ '. If  $(a, b)$  does not belong to  $R$ , then  $a$  is not related to  $b$  and it is written as ' $a \not R b$ '.

### 2. Domain, Co-domain and Range of a Relation

Let  $R$  be a relation from  $A$  to  $B$ . Then the 'domain of  $R$ '  $\subset A$  and the 'range of  $R$ '  $\subset B$ . Co-domain is either set  $B$  or any of its superset or subset containing range of  $R$ .

### 3. Types of Relations

- A relation  $R$  in a set  $A$  is called an **empty** relation if no element of  $A$  is related to any element of  $A$ , i.e.  $R = \emptyset \subset A \times A$ .
- A relation  $R$  in a set  $A$  is called a **universal** relation if each element of  $A$  is related to every element of  $A$ , i.e.  $R = A \times A$ .

### 4. A relation $R$ on a set $A$ is called:

- Reflexive**, if  $(a, a) \in R$  for every  $a \in A$ .
- Symmetric**, if  $(a_1, a_2) \in R$  implies that  $(a_2, a_1) \in R$  for all  $a_1, a_2 \in A$ .
- Transitive**, if  $(a_1, a_2) \in R$  and  $(a_2, a_3) \in R$  implies that  $(a_1, a_3) \in R$  for all  $a_1, a_2, a_3 \in A$ .

### 5. Equivalence Relation

- A relation  $R$  in a set  $A$  is said to be an **equivalence relation** if  $R$  is reflexive, symmetric and transitive.
- An empty relation  $R$  on a non-empty set  $X$  (i.e. ' $a R b$ ' is never true) is not an equivalence relation, because although it is vacuously symmetric and transitive, but it is not reflexive (except when  $X$  is also empty).

### 6. Given an arbitrary equivalence relation $R$ in a set $X$ , $R$ divides $X$ into mutually disjoint subsets

$S_i$  called partitions or subdivisions of  $X$  provided:

- a. All elements of  $S_i$  are related to each other for all  $i$ .
- b. No element of  $S_i$  is related to any element of  $S_j$  if  $i \neq j$ .
- c.  $\bigcup_{i=1}^n S_i = X$  and  $S_i \cap S_j = \emptyset$  if  $i \neq j$ .

The subsets  $S_j$  are called equivalence classes.

## 7. Union, Intersection and Inverse of Equivalence Relations

- a. If  $R$  and  $S$  are two equivalence relations on a set  $A$ ,  $R \cap S$  is also an equivalence relation on  $A$ .
- b. The union of two equivalence relations on a set is not necessarily an equivalence relation on the set.
- c. The inverse of an equivalence relation is an equivalence relation.

## Top Concepts in Functions

### 1. Introduction to functions

A function from a non-empty set  $A$  to another non-empty set  $B$  is a correspondence or a rule which associates every element of  $A$  to a unique element of  $B$  written as  $f : A \rightarrow B$  such that  $f(x) = y$  for all  $x \in A, y \in B$ .

All functions are relations, but the converse is not true.

### 2. Domain, Co-domain and Range of a Function

- If  $f : A \rightarrow B$  is a function, then set  $A$  is the domain, set  $B$  is the co-domain and set  $\{f(x) : x \in A\}$  is the range of  $f$ .
- The range is a subset of the co-domain.
- A function can also be regarded as a machine which gives a unique output in set  $B$  corresponding to each input from set  $A$ .
- If  $A$  and  $B$  are two sets having  $m$  and  $n$  elements, respectively, then the total number of functions from  $A$  to  $B$  is  $n^m$ .

### 3. Real Function

- A function  $f : A \rightarrow B$  is called a real-valued function if  $B$  is a subset of  $\mathbb{R}$ .
- If  $A$  and  $B$  both are subsets of  $\mathbb{R}$ , then ' $f$ ' is called a real function.
- While describing real functions using mathematical formula,  $x$  (the input) is the independent variable and  $y$  (the output) is the dependent variable.
- The graph of a real function ' $f$ ' consists of points whose co-ordinates  $(x, y)$  satisfy  $y=f(x)$ , for all  $x \in \text{Domain}(f)$ .

### 4. Vertical line test

A curve in a plane represents the graph of a real function if and only if no vertical line intersects it more than once.

## 5. One-one Function

- A function  $f : A \rightarrow B$  is **one-to-one** if for all  $x, y \in A$ ,  $f(x) = f(y) \Rightarrow x = y$  or  $x \neq y \Rightarrow f(x) \neq f(y)$
- A one-one function is known as an injection or **injective** function. Otherwise,  $f$  is called many-one.

## 6. Onto Function

- A function  $f : A \rightarrow B$  is an **onto** function, if for each  $b \in B$ , there is at least one  $a \in A$  such that  $f(a) = b$ , i.e. if every element in  $B$  is the image of some element in  $A$ , then  $f$  is an onto or **surjective** function.
- For an onto function, range = co-domain.
- A function which is both one-one and onto is called a **bijection** function or a bijection.
- A one-one function defined from a finite set to itself is always onto, but if the set is infinite, then it is not the case.

7. Let  $A$  and  $B$  be two finite sets and  $f : A \rightarrow B$  be a function.

- a. If  $f$  is an injection, then  $n(A) \leq n(B)$ .
- b. If  $f$  is a surjection, then  $n(A) \geq n(B)$ .
- c. If  $f$  is a bijection, then  $n(A) = n(B)$ .

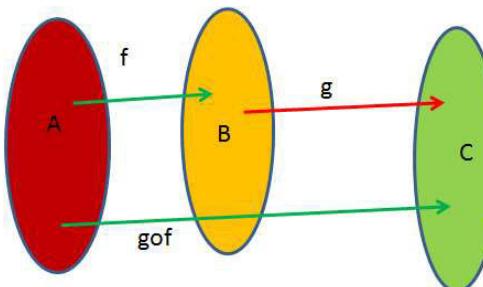

8. If  $A$  and  $B$  are two non-empty finite sets containing  $m$  and  $n$  elements, respectively, then

- Number of functions from  $A$  to  $B = n^m$
- Number of one-one functions from  $A$  to  $B = \begin{cases} {}^n C_m \times m!, & \text{if } n \geq m \\ 0, & \text{if } n < m \end{cases}$
- Number of onto functions from  $A$  to  $B = \begin{cases} \sum_{r=1}^n (-1)^{n-r} {}^n C_r r^m, & \text{if } m \geq n \\ 0, & \text{if } m < n \end{cases}$
- Number of one-one and onto functions from  $A$  to  $B = \begin{cases} n!, & \text{if } m = n \\ 0, & \text{if } m \neq n \end{cases}$

9. If a function  $f : A \rightarrow B$  is not an onto function, then  $f : A \rightarrow f(A)$  is always an onto function.

## 10. Composition of Functions

- Let  $f : A \rightarrow B$  and  $g : B \rightarrow C$  be two functions. The composition of  $f$  and  $g$ , denoted by  $g \circ f$ , is defined as the function  $g \circ f : A \rightarrow C$  and is given by  $g \circ f(x) : A \rightarrow C$  defined by  $g \circ f(x) = g(f(x)) \forall x \in A$ .

- Composition of  $f$  and  $g$  is written as  $g \circ f$  and not  $f \circ g$ .
- $g \circ f$  is defined if the range of  $f \subseteq$  domain of  $g$ , and  $f \circ g$  is defined if the range of  $g \subseteq$  domain of  $f$ .
- Composition of functions is not commutative in general i.e.,  $f \circ g(x) \neq g \circ f(x)$ .
- Composition is associative i.e. if  $f : X \rightarrow Y$ ,  $g : Y \rightarrow Z$  and  $h : Z \rightarrow S$  are functions, then  $h \circ (g \circ f) = (h \circ g) \circ f$ .

- The composition of two bijections is a bijection.

### 11. Inverse of a Function

- Let  $f : A \rightarrow B$  is a bijection, then  $g : B \rightarrow A$  is inverse of  $f$  if  $f(x) = y \Leftrightarrow g(y) = x$  OR  $g \circ f = I_A$  and  $f \circ g = I_B$
- If  $g \circ f = I_A$  and  $f$  is an injection, then  $g$  is a surjection.
- If  $f \circ g = I_B$  and  $f$  is a surjection, then  $g$  is an injection.

### 12. Let $f : A \rightarrow B$ and $g : B \rightarrow C$ be two functions. Then

- $g \circ f : A \rightarrow C$  is onto  $\Rightarrow g : B \rightarrow C$  is onto
- $g \circ f : A \rightarrow C$  is one-one  $\Rightarrow f : A \rightarrow B$  is one-one
- $g \circ f : A \rightarrow C$  is onto and  $g : B \rightarrow C$  is one-one  $\Rightarrow f : A \rightarrow B$  is onto
- $g \circ f : A \rightarrow C$  is one-one and  $f : A \rightarrow B$  is onto  $\Rightarrow g : B \rightarrow C$  is one-one

### 13. Invertible Function

- A function  $f : X \rightarrow Y$  is defined to be invertible if there exists a function  $g : Y \rightarrow X$  such that  $g \circ f = I_X$  and  $f \circ g = I_Y$ .
- The function  $g$  is called the inverse of  $f$  and is denoted by  $f^{-1}$ . If  $f$  is invertible, then  $f$  must be one-one and onto, and conversely, if  $f$  is one-one and onto, then  $f$  must be invertible.
- If  $f : A \rightarrow B$  and  $g : B \rightarrow C$  are one-one and onto, then  $g \circ f : A \rightarrow C$  is also one-one and onto. But if  $g \circ f$  is one-one, then only  $f$  is one-one and  $g$  may or may not be one-one. If  $g \circ f$  is onto, then  $g$  is onto and  $f$  may or may not be onto.
- Let  $f : X \rightarrow Y$  and  $g : Y \rightarrow Z$  be two invertible functions. Then  $g \circ f$  is also invertible with  $(g \circ f)^{-1} = f^{-1} \circ g^{-1}$ .
- If  $f : R \rightarrow R$  is invertible,  $f(x) = y$ , then  $f^{-1}(y) = x$  and  $(f^{-1})^{-1}$  is the function  $f$  itself.

## Binary Operations

1. A binary operation  $*$  on a set  $A$  is a function from  $A \times A$  to  $A$ .
2. If  $*$  is a binary operation on a set  $S$ , then  $S$  is closed with respect to  $*$ .
3. **Binary operations on R**
  - Addition, subtraction and multiplication are binary operations on  $R$ , which is the set of real numbers.
  - Division is not binary on  $R$ ; however, division is a binary operation on  $R - \{0\}$ , which is the set of non-zero real numbers.
4. **Laws of Binary Operations**
  - A binary operation  $*$  on the set  $X$  is called commutative, if  $a * b = b * a$ , for every  $a, b \in X$ .
  - A binary operation  $*$  on the set  $X$  is called associative, if  $a * (b * c) = (a * b) * c$ , for every  $a, b, c \in X$ .
  - An element  $e \in A$  is called an **identity** of  $A$  with respect to  $*$  if for each  $a \in A$ ,  $a * e = a = e * a$ .
  - The identity element of  $(A, *)$ , if it exists, is **unique**.

**5. Existence of Inverse**

- Given a binary operation  $*$  from  $A \times A \rightarrow A$  with the identity element  $e$  in  $A$ , an element  $a \in A$  is said to be invertible with respect to the operation  $*$ , if there exists an element  $b$  in  $A$  such that  $a * b = e = b * a$  and  $b$  is called the inverse of  $a$  and is denoted by  $a^{-1}$ .

**6. If the operation table is symmetric about the diagonal line, then the operation is commutative.**

*	a	b	c	d
a	a	b	c	d
b	b	c	d	a
c	c	d	a	b
d	d	a	b	c

The operation  $*$  is commutative.

**7. Binary Operation on Natural Numbers**

Addition ' $+$ ' and multiplication ' $\cdot$ ' on  $N$ , the set of natural numbers, are binary operations. However, subtraction ' $-$ ' and division are not, because  $(4, 5) = 4 - 5 = -1 \notin N$  and  $4/5 = .8 \notin N$ .

**8. Number of Binary Operations**

- Let  $S$  be a finite set consisting of  $n$  elements. Then  $S \times S$  has  $n^2$  elements.
- The total number of functions from a finite set  $A$  to a finite set  $B$  is  $[n(B)]^{n(A)}$ . Therefore, the total number of binary operations on  $S$  is  $n^{n^2}$ .
- The total number of commutative binary operations on a set consisting of  $n$  elements is  $n^{\frac{n(n-1)}{2}}$ .

# MIND MAP : LEARNING MADE SIMPLE

## CHAPTER - 1

The composition of functions  $f : A \rightarrow B$  and  $g : B \rightarrow C$  is denoted by  $gof$ , and is defined as  $gof : A \rightarrow C$  given by  $gof(x) = g(f(x)) \forall x \in A$ . e.g. let  $A = N$  and  $f, g : N \rightarrow N$  such that  $f(x) = x^2$  and  $g(x) = x^3 \forall x \in N$ . Then  $gof(2) = g(f(2)) = g(2^2) = 4^3 = 64$ .

A function  $f : x \rightarrow y$  is invertible, if  $\exists$  a function  $g : y \rightarrow x$  such that  $gof = I_x$  and  $gog = I_y$ . Then,  $g$  is the inverse of  $f$ . If  $f$  is invertible, then it is both one-one and onto and vice-versa. For e.g. If  $f(x) = x$  and  $f : N \rightarrow N$ , then  $f$  is invertible. **Theorem 1 :** If  $f : x \rightarrow y$ ,  $g : y \rightarrow z$  and  $h : z \rightarrow s$  are functions, then  $h \circ (g \circ f) = (h \circ g) \circ f$ . **Theorem 2 :** Let  $f : x \rightarrow y$  and  $g : y \rightarrow z$  be two invertible functions, then  $gof$  is invertible and  $(gof)^{-1} = f^{-1} \circ g^{-1}$ .

Types of Functions  
Relations and Functions

A relation  $R : A \rightarrow A$  is empty if  $a R b \forall a, b \in A$ .  $R = \emptyset \subset A \times A$ . For e.g.  $R = \{(a, b) : a = b^2\}, A = \{1, 5, 10\}$

Empty relations  
Trivial Relations

A relation  $R : A \rightarrow A$  is universal if  $a R b \forall a, b \in A, R = A \times A$ . if  $R = \emptyset$ , then  $R$  is universal.

Universal relation  
Reflexive relation  
Symmetric relation  
Transitive relation

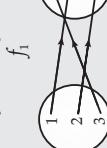

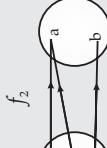

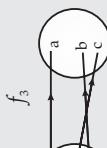

A relation  $R : A \rightarrow A$  is reflexive if  $aRa \forall a \in A$

A relation  $R : A \rightarrow A$  is symmetric if  $a R b \Rightarrow b R a \forall a, b \in A$

A relation  $R : A \rightarrow A$  is transitive if  $a R b, b R c \Rightarrow a R c \forall a, b, c \in A$ .

Equivalence relation (reflexive, symmetric, transitive e.g., Let  $T$  = the set of all triangles in a plane and  $R : T \rightarrow T$  defined by  $R = \{(T_1, T_2) : T_1$  is congruent to  $T_2\}$ . Then,  $R$  is equivalence.

$f : x \rightarrow y$  is both one-one and onto, then  $f$  is bijective.  $f$  is bijective.

$f_1$    
 $f_2$    
 $f_3$  

## Important Questions

### Multiple Choice questions-

1. Let  $R$  be the relation in the set  $\{1, 2, 3, 4\}$ , given by:

$$R = \{(1, 2), (2, 2), (1, 1), (4, 4), (1, 3), (3, 3), (3, 2)\}.$$

Then:

- (a)  $R$  is reflexive and symmetric but not transitive
- (b)  $R$  is reflexive and transitive but not symmetric
- (c)  $R$  is symmetric and transitive but not reflexive
- (d)  $R$  is an equivalence relation.

2. Let  $R$  be the relation in the set  $N$  given by:  $R = \{(a, b) : a = b - 2, b > 6\}$ . Then:

- (a)  $(2, 4) \in R$
- (b)  $(3, 8) \in R$
- (c)  $(6, 8) \in R$
- (d)  $(8, 7) \in R$ .

3. Let  $A = \{1, 2, 3\}$ . Then number of relations containing  $\{1, 2\}$  and  $\{1, 3\}$ , which are reflexive and symmetric but not transitive is:

- (a) 1
- (b) 2
- (c) 3
- (d) 4.

4. Let  $A = \{1, 2, 3\}$ . Then the number of equivalence relations containing  $(1, 2)$  is

- (a) 1
- (b) 2
- (c) 3
- (d) 4.

5. Let  $f: R \rightarrow R$  be defined as  $f(x) = x^4$ . Then

- (a)  $f$  is one-one onto
- (b)  $f$  is many-one onto
- (c)  $f$  is one-one but not onto
- (d)  $f$  is neither one-one nor onto.

6. Let  $f: R \rightarrow R$  be defined as  $f(x) = 3x$ . Then

- (a)  $f$  is one-one onto
- (b)  $f$  is many-one onto
- (c)  $f$  is one-one but not onto
- (d)  $f$  is neither one-one nor onto.

7. If  $f: R \rightarrow R$  be given by  $f(x) = (3 - x^3)^{1/3}$ , then  $f \circ f(x)$  is

- (a)  $x^{1/3}$
- (b)  $x^3$
- (c)  $x$
- (d)  $3 - x^3$ .

8. Let  $f: R - \{-\frac{4}{3}\} \rightarrow R$  be a function defined as:  $f(x) = \frac{4x}{3x + 4}$ ,  $x \neq -\frac{4}{3}$ . The inverse of  $f$  is map  $g$ : Range  $f \rightarrow R - \{-\frac{4}{3}\}$  given by

- (a)  $g(y) = \frac{3y}{3 - 4y}$
- (b)  $g(y) = \frac{4y}{4 - 3y}$
- (c)  $g(y) = \frac{4y}{3 - 4y}$
- (d)  $g(y) = \frac{3y}{4 - 3y}$

9. Let  $R$  be a relation on the set  $N$  of natural numbers defined by  $nRm$  if  $n$  divides  $m$ . Then  $R$  is

- (a) Reflexive and symmetric

- (b) Transitive and symmetric
- (c) Equivalence
- (d) Reflexive, transitive but not symmetric.

10. Set A has 3 elements, and the set B has 4 elements. Then the number of injective mappings that can be defined from A to B is:

- (a) 144
- (b) 12
- (c) 24
- (d) 64

### Very Short Questions:

1. If  $R = \{(x, y) : x + 2y = 8\}$  is a relation in  $N$ , write the range of  $R$ .
2. Show that a one-one function:  
 $f \{1, 2, 3\} \rightarrow \{1, 2, 3\}$  must be onto. (N.C.E.R.T.)
3. What is the range of the function  $f(x) = \frac{|x - 1|}{x - 1}$ ? (C.B.S.E. 2010)
4. Show that the function  $f : N \rightarrow N$  given by  $f(x) = 2x$  is one-one but not onto. (N.C.E.R.T.)
5. If  $f : R \rightarrow R$  is defined by  $f(x) = 3x + 2$  find  $f(f(x))$ . C.B.S.E. 2011 (F)
6. If  $f(x) = \frac{x}{x - 1}$ ,  $x \neq 1$  then find  $f \circ f$ . (N.C.E.R.T.)
7. If  $f : R \rightarrow R$  is defined by  $f(x) = (3 - x^3)^{1/3}$ , find  $f \circ f(x)$
8. Are  $f$  and  $g$  both necessarily onto, if  $g \circ f$  is onto? (N.C.E.R.T.)

### Short Questions:

1. Let  $A$  be the set of all students of a Boys' school. Show that the relation  $R$  in  $A$  given by:  
 $R = \{(a, b) : a$  is sister of  $b\}$  is an empty relation and the relation  $R'$  given by :  
 $R' = \{(a, b) : \text{the difference between heights of } a \text{ and } b \text{ is less than } 3 \text{ metres}\}$  is an universal relation. (N.C.E.R.T.)

2. Let  $f : X \rightarrow Y$  be a function. Define a relation  $R$  in  $X$  given by :

$$R = \{(a, b) : f(a) = f(b)\}.$$

Examine, if  $R$  is an equivalence relation. (N.C.E.R.T.)

3. Let  $R$  be the relation in the set  $Z$  of integers given by:

$$R = \{(a, b) : 2 \text{ divides } a - b\}.$$

Show that the relation  $R$  is transitive. Write the equivalence class  $[0]$ . (C.B.S.E. Sample Paper 2019-20)

4. Show that the function:

$$f : N \rightarrow N$$

given by  $f(1) = f(2) = 1$  and  $f(x) = x - 1$ , for every  $x > 2$  is onto but not one-one. (N.C.E.R.T.)

5. Find  $g \circ f$  and  $f \circ g$ , if:

$f : R \rightarrow R$  and  $g : R \rightarrow R$  are given by  $f(x) = \cos x$  and  $g(x) = 3x^2$ . Show that  $g \circ f \neq f \circ g$ . (N.C.E.R.T.)

6. If  $f(x) = \frac{4x+3}{6x-4}$ ,  $x \neq \frac{2}{3}$  find  $f \circ f(x)$

7. Let  $A = N \times N$  be the set of all ordered pairs of natural numbers and  $R$  be the relation on the set  $A$  defined by  $(a, b) R (c, d)$  iff  $ad = bc$ . Show that  $R$  is an equivalence relation.

8. Let  $f : R \rightarrow R$  be the Signum function defined as:

$$f(x) = \begin{cases} 1, & x > 0 \\ 0, & x = 0 \\ -1, & x < 0 \end{cases}$$

and  $g : R \rightarrow R$  be the Greatest Integer Function given by  $g(x) = [x]$ , where  $[x]$  is greatest integer less than or equal to  $x$ . Then does  $g \circ f$  and  $f \circ g$  coincide in  $(0, 1]$ ?

### Long Questions:

1. Show that the relation  $R$  on  $R$  defined as  $R = \{(a, b) : a \leq b\}$ , is reflexive and transitive but not symmetric.
2. Prove that function  $f : N \rightarrow N$ , defined by  $f(x) = x^2 + x + 1$  is one-one but not onto. Find inverse of  $f : N \rightarrow S$ , where  $S$  is range of  $f$ .

3. Let  $A = \{x \in \mathbb{Z} : 0 \leq x \leq 12\}$ .

Show that  $R = \{(a, b) : a, b \in A; |a - b| \text{ is divisible by } 4\}$  is an equivalence relation. Find the set of all elements related to 1. Also write the equivalence class [2]. (C.B.S.E 2018)

4. Prove that the function  $f: [0, \infty) \rightarrow \mathbb{R}$  given by  $f(x) = 9x^2 + 6x - 5$  is not invertible. Modify the co-domain of the function  $f$  to make it invertible, and hence find  $f^{-1}$ . (C.B.S.E. Sample Paper 2018-19)

## Assertion and Reason Questions-

1. Two statements are given—one labelled Assertion (A) and the other labelled Reason (R). Select the correct answer to these questions from the codes(a), (b), (c) and (d) as given below.

- a) Both A and R are true and R is the correct explanation of A.
- b) Both A and R are true but R is not the correct explanation of A.
- c) A is true but R is false.
- d) A is false and R is also false.

**Assertion(A):** Let  $L$  be the set of all lines in a plane and  $R$  be the relation in  $L$  defined as  $R = \{(L_1, L_2) : L_1 \text{ is perpendicular to } L_2\}$ .  $R$  is not equivalence relation.

**Reason (R):**  $R$  is symmetric but neither reflexive nor transitive

2. Two statements are given—one labelled Assertion (A) and the other labelled Reason (R). Select the correct answer to these questions from the codes(a), (b), (c) and (d) as given below.

- a) Both A and R are true and R is the correct explanation of A.
- b) Both A and R are true but R is not the correct explanation of A.
- c) A is true but R is false.
- d) A is false and R is also false.

**Assertion (A):**  $= \{(T_1, T_2) : T_1 \text{ is congruent to } T_2\}$ . Then  $R$  is an equivalence relation.

**Reason(R):** Any relation  $R$  is an equivalence relation, if it is reflexive, symmetric and transitive.

## Case Study Questions-

1. Consider the mapping  $f: A \rightarrow B$  is defined by  $f(x) = x - 1$  such that  $f$  is a bijection.

Based on the above information, answer the following questions.

- (i) Domain of  $f$  is:

- a)  $R - \{2\}$
- b)  $R$
- c)  $R - \{1, 2\}$
- d)  $R - \{0\}$

(ii) Range of  $f$  is:

- a)  $R$
- b)  $R - \{2\}$
- c)  $R - \{0\}$
- d)  $R - \{1, 2\}$

(iii) If  $g: R - \{2\} \rightarrow R - \{1\}$  is defined by  $g(x) = 2f(x) - 1$ , then  $g(x)$  in terms of  $x$  is:

- a.  $\frac{x+2}{x}$
- b.  $\frac{x+1}{x-2}$
- c.  $\frac{x-2}{x}$
- d.  $\frac{x}{x-2}$

(iv) The function  $g$  defined above, is:

- a) One-one
- b) Many-one
- c) into
- d) None of these

(v) A function  $f(x)$  is said to be one-one if.

- a.  $f(x_1) = f(x_2) \Rightarrow x_1 = x_2$
- b.  $f(-x_1) = f(-x_2) \Rightarrow x_1 = x_2$
- c.  $f(x_1) = f(x_2) \Rightarrow x_1 = x_2$
- d. None of these

**2.** A relation  $R$  on a set  $A$  is said to be an equivalence relation on  $A$  iff it is:

- I.** Reflexive i.e.,  $(a, a) \in R \forall a \in A$ .
- II.** Symmetric i.e.,  $(a, b) \in R \Rightarrow (b, a) \in R \forall a, b \in A$ .
- III.** Transitive i.e.,  $(a, b) \in R$  and  $(b, c) \in R \Rightarrow (a, c) \in R \forall a, b, c \in A$ .

Based on the above information, answer the following questions.

(i) If the relation  $R = \{(1, 1), (1, 2), (1, 3), (2, 2), (2, 3), (3, 1), (3, 2), (3, 3)\}$  defined on the set  $A = \{1, 2, 3\}$ , then  $R$  is:

- a) Reflexive
- b) Symmetric
- c) Transitive
- d) Equivalence

(ii) If the relation  $R = \{(1, 2), (2, 1), (1, 3), (3, 1)\}$  defined on the set  $A = \{1, 2, 3\}$ , then  $R$  is:

- a) Reflexive
- b) Symmetric
- c) Transitive
- d) Equivalence

(iii) If the relation  $R$  on the set  $N$  of all natural numbers defined as  $R = \{(x, y) : y = x + 5 \text{ and } x < 4\}$ , then  $R$  is:

- a) Reflexive
- b) Symmetric
- c) Transitive
- d) Equivalence

(iv) If the relation  $R$  on the set  $A = \{1, 2, 3, \dots, 13, 14\}$  defined as  $R = \{(x, y) : 3x - y = 0\}$ , then  $R$  is:

- a) Reflexive
- b) Symmetric
- c) Transitive
- d) Equivalence

(v) If the relation  $R$  on the set  $A = \{1, 2, 3\}$  defined as  $R = \{(1, 1), (1, 2), (1, 3), (2, 1), (2, 2), (2, 3), (3, 1), (3, 2), (3, 3)\}$ , then  $R$  is:

- a) Reflexive only
- b) Symmetric only
- c) Transitive only
- d) Equivalence

### Answer Key-

#### Multiple Choice questions-

(b)  $R$  is reflexive and transitive but not symmetric

(c)  $(6, 8) \in R$

(a) 1

(b) 2

(d)  $f$  is neither one-one nor onto.

(a)  $f$  is one-one onto

(c)  $x$

(b)  $g(y) = \frac{4y}{4 - 3y}$

(b) Transitive and symmetric

(c) 24

### Very Short Answer:

1. Solution: Range of  $R = \{1, 2, 3\}$ .

[ $\because$  When  $x = 2$ , then  $y = 3$ , when  $x = 4$ , then  $y = 2$ , when  $x = 6$ , then  $y = 1$ ]

2. Solution: Since ' $f$ ' is one-one,

$\therefore$  under ' $f$ ', all the three elements of  $\{1, 2, 3\}$  should correspond to three different elements of the co-domain  $\{1, 2, 3\}$ .

Hence, ' $f$ ' is onto.

3. Solution: When  $x > 1$ ,

$$\text{then } f(x) = \frac{x-1}{x-1} = 1.$$

When  $x < 1$ ,

$$\text{then } f(x) = \frac{-(x-1)}{x-1} = -1$$

Hence,  $Rf = \{-1, 1\}$ .

4. Solution:

Let  $x_1, x_2 \in N$ .

$$\text{Now, } f(x_1) = f(x_2)$$

$$\Rightarrow 2x_1 = 2x_2$$

$$\Rightarrow x_1 = x_2$$

$\Rightarrow f$  is one-one.

Now,  $f$  is not onto.

$\because$  For  $1 \in N$ , there does not exist any  $x \in N$  such that  $f(x) = 2x = 1$ .

Hence,  $f$  is one-one but not onto.

5. Solution:

$$f(f(x)) = 3f(x) + 2$$

$$= 3(3x + 2) + 2 = 9x + 8.$$

6. Solution:

$$\begin{aligned} fof(x) &= f(f(x)) = \frac{f(x)}{f(x)-1} \\ &= \frac{\frac{x}{x-1}}{\frac{x}{x-1}-1} = \frac{x}{x-x+1} \\ &= \frac{x}{1} = x. \end{aligned}$$

7. Solution:

$$f \circ f(x) = f(f(x)) = (3 - (f(x))^3)^{1/3}$$

$$= (3 - ((3 - x^3)^{1/3})^3)^{1/3}$$

$$= (3 - (3 - x^3))^{1/3} = (x^3)^{1/3} = x.$$

8. Solution:

Consider  $f: \{1, 2, 3, 4\} \rightarrow \{1, 2, 3, 4\}$

and  $g: \{1, 2, 3, 4\} \rightarrow \{1, 2, 3\}$  defined by:

$$f(1) = 1, f(2) = 2, f(3) = f(4) = 3$$

$$g(1) = 1, g(2) = 2, g(3) = g(4) = 3.$$

$\therefore \text{gof} = g(f(x)) \{1, 2, 3\}$ , which is onto

But  $f$  is not onto.

$[\because 4 \text{ is not the image of any element}]$

### Short Answer:

1. Solution:

(i) Here  $R = \{(a, b) : a \text{ is sister of } b\}$ .

Since the school is a Boys' school,

$\therefore$  no student of the school can be the sister of any student of the school.

Thus  $R = \emptyset$  Hence,  $R$  is an empty relation.

(ii) Here  $R' = \{(a, b) : \text{the difference between heights of } a \text{ and } b \text{ is less than } 3 \text{ metres}\}$ .

Since the difference between heights of any two students of the school is to be less than 3 metres,

$\therefore R' = A \times A$ . Hence,  $R'$  is a universal relation.

2. Solution:

For each  $a \in X$ ,  $(a, a) \in R$ .

Thus  $R$  is reflexive.  $[\because f(a) = f(a)]$

Now  $(a, b) \in R$

$$\Rightarrow f(a) = f(b)$$

$$\Rightarrow f(b) = f(a)$$

$$\Rightarrow (b, a) \in R.$$

Thus  $R$  is symmetric.

And  $(a, b) \in R$

and  $(b, c) \in R$

$$\Rightarrow f(a) = f(b)$$

$$\text{and } f(b) = f(c)$$

$$\Rightarrow f(a) = f(c)$$

$$\Rightarrow (a, c) \in R.$$

Thus R is transitive.

Hence, R is an equivalence relation.

3. Solution:

Let 2 divide  $(a - b)$  and 2 divide  $(b - c)$ , where  $a, b, c \in \mathbb{Z}$

$$\Rightarrow 2 \text{ divides } [(a - b) + (b - c)]$$

$$\Rightarrow 2 \text{ divides } (a - c).$$

Hence, R is transitive.

And  $[0] = \{0, \pm 2, \pm 4, \pm 6, \dots\}$ .

4. Solution:

Since  $f(1) = f(2) = 1$ ,

$\therefore f(1) = f(2)$ , where  $1 \neq 2$ .

$\therefore 'f'$  is not one-one.

Let  $y \in \mathbb{N}$ ,  $y \neq 1$ ,

we can choose  $x$  as  $y + 1$  such that  $f(x) = x - 1$

$$= y + 1 - 1 = y.$$

Also  $1 \in \mathbb{N}$ ,  $f(1) = 1$ .

Thus 'f' is onto.

Hence, 'f' is onto but not one-one.

5. Solution:

We have:

$$f(x) = \cos x \text{ and } g(x) = 3x^2.$$

$$\therefore \text{gof}(x) = g(f(x)) = g(\cos x)$$

$$= 3(\cos x)^2 = 3 \cos^2 x$$

$$\text{and } \text{fog}(x) = f(g(x)) = f(3x^2) = \cos 3x^2.$$

Hence,  $\text{gof} \neq \text{fog}$ .

6. Solution:

$$\text{We have: } \frac{4x+3}{6x-4} \dots (1)$$

$$\therefore \text{fog}(x) - f(f(x))$$

$$= \frac{4f(x)+3}{6f(x)-4}$$

$$= \frac{4\left(\frac{4x+3}{6x-4}\right)+3}{6\left(\frac{4x+3}{6x-4}\right)-4} \quad [\text{Using (1)}]$$

$$= \frac{16x+12+18x-12}{24x+18-24x+16}$$

$$= \frac{34x}{34} = x.$$

7. Solution:

Given:  $(a, b) R (c, d)$  if and only if  $ad = bc$ .

(I)  $(a, b) R (a, b)$  iff  $ab - ba$ , which is true.

$[\because ab = ba \forall a, b \in \mathbb{N}]$

Thus,  $R$  is reflexive.

(II)  $(a, b) R (c, d) \Rightarrow ad = bc$

$(c, d) R (a, b) \Rightarrow cb = da$ .

But  $cb = be$  and  $da = ad$  in  $\mathbb{N}$ .

$\therefore (a, b) R (c, d) \Rightarrow (c, d) R (a, b)$ .

Thus,  $R$  is symmetric.

(III)  $(a, b) R (c, d)$

$$\Rightarrow ad = bc \dots (1)$$

$(c, d) R (e, f)$

$$\Rightarrow cf = de \dots (2)$$

Multiplying (1) and (2),  $(ad) \cdot (cf) = (be) \cdot (de)$

$$\Rightarrow af = be$$

$$\Rightarrow (a, b) = R(e, f).$$

Thus,  $R$  is transitive.

Thus,  $R$  is reflexive, symmetric and transitive.

Hence,  $R$  is an equivalence relation.

8. Solution:

For  $x \in (0, 1]$ .

$$(fog)(x) = f(g(x)) = f([x])$$

$$= \begin{cases} f(0); & \text{if } 0 < x < 1 \\ f(1); & \text{if } x = 1 \end{cases}$$

$$\Rightarrow f(g(x)) = \begin{cases} 0; & \text{if } 0 < x < 1 \\ 1; & \text{if } x = 1 \end{cases} \dots (1)$$

$$\text{And } (gof)(x) = g(f(x)) = g(1)$$

$$[\because f(x) = 1 \ \forall x > 0]$$

$$= [1] = 1$$

$$\Rightarrow (gof)(x) = 1 \ \forall x \in (0, 1] \dots (2)$$

From (1) and (2),  $(fog)$  and  $(gof)$  do not coincide in  $(0, 1]$ .

### Long Answer:

1. Solution:

We have:  $R = \{(a, b) \mid a \leq b\}$ .

Since,  $a \leq a \forall a \in R$ ,

$$\therefore (a, a) \in R,$$

Thus,  $R$  reflexive.

Now,  $(a, b) \in R$  and  $(b, c) \in R$

$$\Rightarrow a \leq b \text{ and } b \leq c$$

$$\Rightarrow a \leq c$$

$$\Rightarrow (a, c) \in R.$$

Thus,  $R$  is transitive.

But  $R$  is not symmetric

$[\because (3, 5) \in R \text{ but } (5, 3) \notin R \text{ as } 3 \leq 5 \text{ but } 5 > 3]$

Solution:

Let  $x_1, x_2 \in N$ .

Now,  $f(x_1) = f(x_2)$

$$\begin{aligned} &\Rightarrow x_1^2 + x_1 + 1 = x_2^2 + x_2 + 1 \\ &\Rightarrow x_1^2 + x_1 = x_2^2 + x_2 \\ &\Rightarrow (x_1^2 - x_2^2) + (x_1 - x_2) = 0 \\ &\Rightarrow (x_1 - x_2) + (x_1 + x_2 + 1) = 0 \\ &\Rightarrow x_1 - x_2 = 0 \quad [\because x_1 + x_2 + 1 \neq 0] \\ &\Rightarrow x_1 = x_2. \end{aligned}$$

Thus,  $f$  is one-one.

Let  $y \in N$ , then for any  $x$ ,

$$f(x) = y \text{ if } y = x^2 + x + 1$$

$$\Rightarrow y = \left( x^2 + x + \frac{1}{4} \right) + \frac{3}{4}$$

$$\Rightarrow y = \left( x + \frac{1}{2} \right)^2 + \frac{3}{4}$$

$$\Rightarrow x + \frac{1}{2} = \pm \sqrt{y - \frac{3}{4}}$$

$$\Rightarrow x = \pm \frac{\sqrt{4y-3}}{2} - \frac{1}{2}$$

$$\Rightarrow x = \frac{\pm \sqrt{4y-3} - 1}{2}$$

$$\Rightarrow x = \frac{\sqrt{4y-3} - 1}{2}$$

$$\left[ \frac{-\sqrt{4y-3} - 1}{2} \notin N \text{ for any value of } y \right]$$

Now, for  $y = \frac{3}{4}$ ,  $x = -\frac{1}{2} \notin N$ .

Thus,  $f$  is not onto.

$\Rightarrow f(x)$  is not invertible.

Since,  $x > 0$ , therefore,  $\frac{\sqrt{4y-3}-1}{2} > 0$

$$\Rightarrow \sqrt{4y-3} > 1$$

$$\Rightarrow 4y - 3 > 1$$

$$\Rightarrow 4y > 4$$

$$\Rightarrow y > 1.$$

Redefining,  $f : (0, \infty) \rightarrow (1, \infty)$  makes

$f(x) = x^2 + x + 1$  an onto function.

Thus,  $f(x)$  is bijection, hence  $f$  is invertible and  $f^{-1} : (1, \infty) \rightarrow (0, \infty)$

$$f^{-1}(y) = \frac{\sqrt{4y-3}-1}{2}$$

2. Solution:

We have:

$$R = \{(a, b) : a, b \in A; |a - b| \text{ is divisible by 4}\}.$$

(1) Reflexive: For any  $a \in A$ ,

$$\therefore (a, a) \in R.$$

$$|a - a| = 0, \text{ which is divisible by 4.}$$

Thus,  $R$  is reflexive.

Symmetric:

Let  $(a, b) \in R$

$$\Rightarrow |a - b| \text{ is divisible by 4}$$

$$\Rightarrow |b - a| \text{ is divisible by 4}$$

Thus,  $R$  is symmetric.

Transitive: Let  $(a, b) \in R$  and  $(b, c) \in R$

$$\Rightarrow |a - b| \text{ is divisible by 4 and } |b - c| \text{ is divisible by 4}$$

$$\Rightarrow |a - b| = 4\lambda$$

$$\Rightarrow a - b = \pm 4\lambda \dots\dots\dots(1)$$

$$\text{and } |b - c| = 4\mu$$

$$\Rightarrow b - c = \pm 4\mu \dots\dots\dots(2)$$

Adding (1) and (2),

$$(a - b) + (b - c) = \pm 4(\lambda + \mu)$$

$$\Rightarrow a - c = \pm 4(\lambda + \mu)$$

$$\Rightarrow (a, c) \in R.$$

Thus,  $R$  is transitive.

Now,  $R$  is reflexive, symmetric and transitive.

Hence,  $R$  is an equivalence relation.

(ii) Let 'x' be an element of  $A$  such that  $(x, 1) \in R$

$$\Rightarrow |x - 1| \text{ is divisible by 4}$$

$$\Rightarrow x - 1 = 0, 4, 8, 12, \dots$$

$$\Rightarrow x = 1, 5, 9, 13, \dots$$

Hence, the set of all elements of A which are related to 1 is  $\{1, 5, 9\}$ .

(iii) Let  $(x, 2) \in R$ .

Thus  $|x - 2| = 4k$ , where  $k \leq 3$ .

$$\therefore x = 2, 6, 10.$$

Hence, equivalence class  $[2] = \{2, 6, 10\}$ .

3. Solution:

Let  $y \in R$ .

For any  $x$ ,  $f(x) = y$  if  $y = 9x^2 + 6x - 5$

$$\Rightarrow y = (9x^2 + 6x + 1) - 6$$

$$= (3x + 1)^2 - 6$$

$$\Rightarrow 3x + 1 = \pm\sqrt{y+6}$$

$$\Rightarrow x = \frac{\pm\sqrt{y+6} - 1}{3}$$

$$\Rightarrow x = \frac{\sqrt{y+6} - 1}{3}$$

$$\left[ \because \frac{-\sqrt{y+6} - 1}{3} \notin [0, \infty) \text{ for any value of } y \right]$$

For  $y = -6 \in R$ ,  $x = -\frac{1}{3} \notin [0, \infty)$ .

Thus,  $f(x)$  is not onto.

Hence,  $f(x)$  is not invertible.

$$\text{Since, } x \geq 0, \therefore \frac{\sqrt{y+6}-1}{3} \geq 0$$

$$\Rightarrow \sqrt{y+6} - 1 \geq 0$$

$$\Rightarrow \sqrt{y+6} \geq 1$$

$$\Rightarrow y+6 \geq 1$$

$$\Rightarrow y \geq -5.$$

We redefine,

$$f: [0, \infty) \rightarrow [-5, \infty),$$

which makes  $f(x) = 9x^2 + 6x - 5$  an onto function.

Now,  $x_1, x_2 \in [0, \infty)$  such that  $f(x_1) = f(x_2)$

$$\Rightarrow (3x_1 + 1)^2 = (3x_2 + 1)^2$$

$$\Rightarrow [(3x_1 + 1) + (3x_2 + 1)][(3x_1 + 1) - (3x_2 + 1)]$$

$$\Rightarrow [3(x_1 + x_2) + 2][3(x_1 - x_2)] = 0$$

$$\Rightarrow x_1 = x_2$$

$$[\because 3(x_1 + x_2) + 2 > 0]$$

Thus,  $f(x)$  is one-one.

$\therefore f(x)$  is bijective, hence  $f$  is invertible

and  $f^{-1}: [-5, \infty) \rightarrow [0, \infty)$

$$f^{-1}(y) = \frac{\sqrt{y+6}-1}{3}$$

## Assertion and Reason Answers-

1. (a) Both A and R are true and R is the correct explanation of A.

2. (a) Both A and R are true and R is the correct explanation of A.

## Case Study Answers-

1. Answer :

(i) (a)  $R - \{2\}$

**Solution:**

For  $f(x)$  to be defined  $x - 2; \neq 0$  i.e.,  $x; \neq 2$ .

$\therefore$  Domain of  $f = R - \{2\}$

(ii) (b)  $R - \{2\}$

**Solution:**

Let  $y = f(x)$ , then  $y = \frac{x-1}{x-2}$

$$\Rightarrow xy - 2y = x - 1 \Rightarrow xy - x = 2y -$$

$$\Rightarrow x = \frac{2y-1}{y-1}$$

Since,  $x \in R - \{2\}$ , therefore  $y \neq 1$

Hence, range of  $f = R - \{1\}$

(iii) (d)  $\frac{x}{x-2}$

**Solution:**

We have,  $g(x) = 2f(x) - 1$

$$= 2\left(\frac{x-1}{x-2}\right) - 1 = \frac{2x-2-x+2}{x-2} = \frac{x}{x-2}$$

(iv) (a) One-one

**Solution:**

We have,  $g(x) = \frac{x}{x-2}$

$$\text{Let } g(x_1) = g(x_2) \Rightarrow \frac{x_1}{x_1-2} = \frac{x_2}{x_2-2}$$

$$\Rightarrow x_1x_2 - 2x_1 = x_1x_2 - 2x_2 \Rightarrow 2x_1 = 2x_2 \Rightarrow x_1 = x_2$$

$$\text{Thus, } g(x_1) = g(x_2) \Rightarrow x_1 = x_2$$

Hence,  $g(x)$  is one-one.

(v) (c)  $f(x_1) = f(x_2) \Rightarrow x_1 = x_2$

**2. Answer :**

(i) (a) Reflexive

**Solution:**

Clearly,  $(1, 1), (2, 2), (3, 3) \in R$ . So,  $R$  is reflexive on  $A$ .

Since,  $(1, 2) \in R$  but  $(2, 1) \notin R$ . So,  $R$  is not symmetric on  $A$ .

Since,  $(2, 3) \in R$  and  $(3, 1) \in R$  but  $(2, 1) \notin R$ . So,  $R$  is not transitive on  $A$ .

## (ii) (b) Symmetric

**Solution:**

Since,  $(1, 1), (2, 2)$  and  $(3, 3)$  are not in  $R$ . So,  $R$  is not reflexive on  $A$ .

Now,  $(1, 2) \in R \Rightarrow (2, 1) \in R$  and  $(1, 3) \in R \Rightarrow (3, 1) \in R$ . So,  $R$  is symmetric,

Clearly,  $(1, 2) \in R$  and  $(2, 1) \in R$  but  $(1, 1) \notin R$ . So,  $R$  is not transitive on  $A$ .

## (iii) (c) Transitive

**Solution:**

We have,  $R = \{(x, y) : y = x + 5 \text{ and } x < 4\}$ , where  $x, y \in N$ .

$\therefore R = \{(1, 6), (2, 7), (3, 8)\}$

Clearly,  $(1, 1), (2, 2)$  etc. are not in  $R$ . So,  $R$  is not reflexive.

Since,  $(1, 6) \in R$  but  $(6, 1) \notin R$ . So,  $R$  is not symmetric.

Since,  $(1, 6) \in R$  and there is no order pair in  $R$  which has 6 as the first element.

Same is the case for  $(2, 7)$  and  $(3, 8)$ . So,  $R$  is transitive.

## (iv) (d) Equivalence

**Solution:**

We have,  $R = \{(x, y) : 3x - y = 0\}$ , where  $x, y \in A = \{1, 2, \dots, 14\}$ .

$\therefore R = \{(1, 3), (2, 6), (3, 9), (4, 12)\}$

Clearly,  $(1, 1) \notin R$ . So,  $R$  is not reflexive on  $A$ .

Since,  $(1, 3) \in R$  but  $(3, 1) \notin R$ . So,  $R$  is not symmetric on  $A$ .

Since,  $(1, 3) \in R$  and  $(3, 9) \in R$  but  $(1, 9) \notin R$ . So,  $R$  is not transitive on  $A$ .

(v) (d) Equivalence

**Solution:**

Clearly,  $(1, 1), (2, 2), (3, 3) \in R$ . So,  $R$  is reflexive on  $A$ .

We find that the ordered pairs obtained by interchanging the components of ordered pairs in  $R$  are also in  $R$ . So,  $R$  is symmetric on  $A$ . For  $1, 2, 3 \in A$  such that  $(1, 2)$  and  $(2, 3)$  are in  $R$  implies that  $(1, 3)$  is also in  $R$ . So,  $R$  is transitive on  $A$ . Thus,  $R$  is an equivalence relation.
